

WHY THE SUPER VAC SV3 MAKES THE CUT

A THE NAME

Every Firefighter knows the name Super Vac. For over 50 years, Super Vac has been synonymous with expertise, innovation, and service in the fire industry. So you can bet that all of this experience went into the design of the new SV3 Ventilation Saw.

B THE AIRMASTER MULTI-CHAMBERED FILTRATION SYSTEM

This two chambered system designed by Dolmar stops larger particles before they reach to the secondary filter. The secondary filter stops the finest particles, without the risk of clogging by the larger splinters and debris. This makes SV3 the machine of choice for rescuers working in particle laden environments.

C LATERAL CHAIN TENSIONING

Developed by Dolmar for fast and easy on-the-spot tension adjustment. Easy to Reach Srench tool holder.

D D-RING PULL HANDLE

The SV3's easy-to-grasp D-Ring handle is a perfect match for hands protected by multi-layered rescue gloves. No more time wasted while fumbling with hard to grasp handles. Once again, Super Vac has shown that they understand that every second counts during life saving operations.

E FAST AND EASY STARTING FEATURES

With a momentary contact switch that leaves the saw in a always on position, compression release that reduces cylinder pressure by 50% and choke knob that simultaneously sets both throttle and choke. These features save critical seconds during rescue operations

F THE CHISEL CHAIN

This .404 carbide tooth chain chisels through layers of material, taking bigger bites and moving faster through wood and layers of asphalt shingles – just what every rescuer needs for quick rooftop operations.

G THE ENGINE

With an unbelievable power to weight ratio, the SV3's 6.3 HP engine rips through material at 13,500 RPM, making this one of the fastest and most powerful rescue saws available. This is the saw you need to get the job done fast, when seconds count.

H FULL WRAP HANDLE

The full wrap around handle makes front facing and overhead operations easier, meaning faster placement of the saw and longer cuts without repositioning. Another Super Vac feature designed for the fire service.

I FULL WRAP DEPTH GUARD

The Super Vac SV3 depth guard manually allows you to set the depth of cut from 0 to 8" inches deep. With a full wrap guard it protects the firefighter from the chain in rescue operations. The guard has a NEW tool-less design to remove the guard from the saw if needed.
